                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a ligand of less than 6 kD that binds to a polypeptide containing the sequence GlyTyTGINFOHISGIYGIY (A) or an analogue that is the retro-inverso isomer of (A). The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in biological or environmental samples, e.g. for diagnosis, also for removing them from samples, for treating or retarding development of prion-associated diseases, specially Creutzfeldt-Jakob diseases (in latrogenic, new variant, familial or sporadic forms), but also Gerstmann-Straussler-Scheinker disease, fatal familial insomnia,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc spongiform encephalopathy, scrapie, feline spongiform encephalopathy, cc chronic wasting disease or transmissible mink encephalopathy. (I) is cuseful for sterilising material contaminated with the TSE agent. A prion cd dimer is useful for examining a sample infected with or suspected to be infected by a prion protein, and for detecting prion infectivity, by cc detecting a prion dimer in the sample. A prion dimer is useful for cc producing (II), by immunising an animal with a prion dimer, obtaining its certract which contains (II), and isolating (II) from the extract. The cc extract which contains (II), and isolating (II) from the extract. The cc extract bind a prion dimer, and removing (II) from the preparation. (M1) cc and (I) are useful for inactivating TSE agents in potentially contaminated clinical waste and culled animal material. (M1) is useful for setrilising larger surface areas of apparatus, operating tables or ceven walls of rooms. The present sequence represents a prion minetic contaminated clinical waste and culled animal material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method (MI) for inactivating a transmissible spongiform encephalopathy (TSD) agent comprising exposing the TSE agent to a thermostable proteolytic enzyme. Also described:
(1) a composition (I) for inactivating a TSE agent, comprising a thermostable proteolytic enzyme; (2) an antibody (II) specific for a prion dimer which does not bind to a prion monomer; and (3) a purified prion dimer. (MI) is useful for inactivating a TSE agent such as a prion. A TSE agent is Croutzfeldt-Jacob disease or its variant, kuru, fatal familial insomnia, Gerstmann-Straussel-Scheinker syndrome, bovine
                                                                 Diagnosis of prion diseases, by treatment with proteinase detecting retention of octapeptide repeat motifs, including differentiation between prion strains \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                            Prion protein; subacute transmissible spongiform encephalopathy; ESST. Creutzfeld-Jakob disease; bovine spongiform encephalopathy; scrapie.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Octa-peptide motif repeated in human prion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         05-SEP-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAB84521;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             preparation of antibodies including dimer preferential antibodies

polypeptide containing the sequence GlyTyrGlyGlnProHisGlyGly (A) or an analogue that is the retro-inverso isomer of (A). The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of subacute transmissible spongiform encephalopathy (ESST) caused by a strain of unconventional transmissible agent. The method comprises detecting abnormal prion protein in a biological sample. The sample is treated with at least one proteinase K while retaining at least some of the octapeptide repeats in the prion protein, then treatment with a ligand for octapeptide repeats and detecting any formation of a complex. The method is used to diagnose ESST, particularly (new variant)

polypeptide containing the sequence GlyTyrGlyGlnProHisGlyGly (A) or an analogue that is the retro-inverso isomer of (A). The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          scrapie, bovine or feline spongiform encephalopathy, transmissible mink or exotic ungulate encephalopathy, or chronic wasting disease. The present sequence is a peptide containing the PrP octapeptide A (containing the octapeptide in a different permutation to that shown in AAU11825) used to isolate the ligands of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             biological or environmental samples, e.g. for diagnosis, also for removing them from samples, for treating or retarding development of prion-associated diseases, especially Creutzfeldt-Jakob diseases (in latrogenic, new variant, familial or sporadic forms), but also Gerstmann-Straussler-Scheinker disease, fatal familial insomnia,

These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PrPc) and the scrapie-associated form (PrPsc). These peptides may include rare or synthetic amino acids or a ratio-inverso peptide modification to improve resistance to enzymatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PrPc) and the scrapie-associated form (PrPsc). These peptides may include rare or synthetic amino acids or a rationnverso peptide modification to improve resistance to enzymatic

                                                                                                                                                                   an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequences given in AAR38025-36 represent polypeptides derived from an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PPPc) and the scrapie-associated form (PPSc). These peptides may include rare or synthetic amino acids or a ratio-inverse peptide modification to improve resistance to enzymatic

The method comprises (a) selecting a polypeptide that has a length of at least 10 amino acids and has an amino acid sequence at least 70% homologous to that of human, bovine or murine PrF in a region of at least 10 consecutive amino acids (b) binding a metal to the polypeptide by reaction with a metal compound and (c) injecting the metal-containing polypeptide into a host animal, optionally together with adjuvants, to induce production of a polyclonal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention claims to provide a method for detecting transmissable spongiform encephalopathies (TSE) in animals and in animal carcasses. The method comprises of an immunological assay whereby the animal test sample is reacted with a labelled antibody against scrapie prion protein (prpSC) and the amount of bound labelled antibody is then detected. The anti-prpSC antibodies used in the assay are raised against fragments of the present synthetic peptide shown. The peptide fragments preferred by the inventors are shown in the features table. The method is claimed to be useful when applied to samples, particularly a cross-section of the spinal cord, from cattle, sheep and pig carcasses for detection of bovine spongiform encephalopathy (BSE) or scrapie.

Conversion of the normal cellular form of PrP into an aggregated, incomplete isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine spongiform Encephalopathy (BSE), scrapic, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a presence of PrP indicates TSE. PrP antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AABO7320-B07326) are derived from the protease resistant core
                                                                                                  Норе Ј,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine spongiform Encephalopathy (BSE), scrapic, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AAB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
The present sequence is the mouse prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease

          The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentra of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epittope is captured by antibody, which is then detected. The presence of PrP indicates TSE. epitopes (AAB07320-B07326) are derived from the protease resistant oc of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                  New immunoassay for prion protein, used for c
